

# The Proof is in the Bucket

Dirty mop water does **NOT** mean your current cleaning tools, chemicals and procedures are working, it means your floor is filthy.

**Used mop water is a window into what condition your floor is in:**

Thick gray mop water is common for a dirty kitchen floor.

Dark or black water is more common in the dining room/restrooms.

- ★ Mopping simply smears dirt and grease across the floor
- ★ The more you mop the dirtier your floor will become
- ★ To offset the damage done by mop you must effectively scrub the floor on a regular basis
- ★ Floor maintenance results can be measured by the color of used mop water
- ★ New safety flooring with textured surfaces compound the problem of mop damage by creating areas of accumulation, dark or black grout, black build up, etc.

**Remember**, it doesn't matter how many times you change your dirty mop water, or how many compartments your mop buckets has, the **ONLY** way to maintain clean mop water is to effectively scrub and lift the residue from the floor on a regular basis!

**The Heavyweight® Solution Brush Kit**

**Insurance Organizations participating in a Heavyweight Solutions Rebate Program:** Marsh, CCMSI, McDonald's Arkansas Self Insurance Trust, Missouri Operator's Insurance Team. Endorsed by CNA, Besnard Insurance and many others.

Ask your carrier if they participate.

Please visit our web site or call to learn more about our common sense approach to floor care.
